Laboratory Exercise 10: React Native (Components, Navigation and Map)
**Prepared by:** John Aimiel C. Pena

**Name:** _____ **Course, Yr. & Sec:** _____
**Student Number:** _____ **Date:** _____

1. Create a Simple Movie Application which includes:
   a) **Home Page:** Welcome Message and a Pressable Button to Link to Movies Page
   b) **Movies Page**: Shows 4 categories(Latest, Top Rated, Popular and Recommended), this 4 categories should be represented using ***map()*** to render each.
      i. This categories must use a Pressable Card to go to its page using a target as the screen name. Make sure the Navigation for this 4 categories in bottom nav is hidden.
   c) **Profile Page**: Just a profile message
   d) **Movie Data:** Export a list of 8 movies minimum of your own theme:
      i. Each Movies must have: **id, title, year, rating desc, image and categories(*categories can be both popular and top rated).***
         1. Local images must use a **require("imagepath")** with the exact name of filename and destination, ***eg: (require("../assets/images/joker.jpg")).***
   e) **MovieCard Componen**t
      i. Recieves the data from props, display the poster beside the text, setting your image with width and height to be small
   **f)** **MovieList Component:**
      i. Receive the title, category and navigation as props to be given as you call this reusable cards for every Movie Category
      ii. Use a filter() to keep only the movies whose categories include the given category, then map to render a MovieCard for each.
         *1.* **eg: *const filtered = MOVIES.filter((movie) => movie.categories.includes(category))***
         *2.* ***{filtered.map()}***
         *3.* Wrap the filtered Map List in the Scrollview using VerticalScrollIndicator = false
   ***g)*** **Category Pages:**
      i. Reuse the **MovieList Component**
   **h)** **Profile Page and Design**
      i. Build the Profile Page
      ii. Design your Application according to your preferences
      iii. TopBar must show your Application Title
2. Set up a Bottom Navigation using : **NavigationContainer & createBottomNavigator**
   a) npx expo install @react-navigation/native @react-navigation/bottom-tabs react-native-screens react-native-safe-area-context
   b) To use CreateBottomNavigator : **const Tab = createBottomNavigator()**
   *Note: Remember the NavigationContainer is the Main Container of the Navigation, which works like BrowserRouter, and to make your TopBar remain at the top the NavigationContainer must be Inside SafeAreaProvider and SafeAreaView. (**SafeAreProvider -> SafeAreaView -> NavigationContainer ->Tab.Navigator -> Tab.Screen**)*
**3. Folder Structure:**
   **a)** Pages for each Pages
   **b)** Data
   **c)** Components
   **d)** Images folder under assets folder

Laboratory Exercise 10: React Native (Components, Navigation and Map)
**Prepared by:** John Aimiel C. Pena

| Laboratory Grading Rubric | | | |
|---|---|---|---|
| **Criteria** | **Definition** | **Points Possible** | **Earned Points** |
| Project Structure & Organization | Follows the required structure: | 15 | |
| Navigation Setup | Correctly uses NavigationContainer and createBottomTabNavigator. Hidden the nav for Movie Categories. | 20 | |
| Pages & Navigation Flow | The Home button opens Movies. Each category card on Movies opens its correct page using navigation.navigate() with an arrow function. | 10 | |
| Data & JSON Mapping | Creates the categories array and the MOVIES array in JSON format with all required fields (at least 8 items, every category with at least 2 items). Uses map() with a unique key to render the categories. | 15 | |
| Components & Props | Builds reusable MovieCard and MovieList components. Passes data to them as props, uses filter() and map() to render only the movies of each category, and reuses MovieList across all four category pages. | 15 | |
| Images | Each item displays a poster with the correct path and a controlled size (width and height) beside the text. | 5 | |
| Original Design & Styling | Applies the student's own color palette, tab bar style, card layout, and TopBar title using Tailwind className and style. The design is organized, consistent, and clearly different from the sample. Profile page shows the student's own details. | 15 | |
| Working App & Code Quality | The app runs without errors, all screens load, there are no unused imports or leftover test code, and className and file names are spelled correctly. | 5 | |
| **Total** | | **100** | |
